

Web designing refers to the visual and aesthetic aspect of a website. It involves creating the layout, look, and feel of the site. Web designers focus on user experience (UX) and user interface (UI) design to ensure the site is visually appealing, easy to navigate, and responsive. CSS3

Web development refers to the technical aspect of building and maintaining websites. It involves writing code to create the website's functionality and ensuring it works correctly...JavaScript framework, React (JavaScript library)

CSS (Cascading Style Sheets) and Bootstrap are both tools used in web design and development to style web pages,

CSS is a stylesheet language used to describe the presentation of a document written in HTML. **Bootstrap** is a popular front-end framework for developing responsive and mobile-first websites. It includes a collection of CSS and JavaScript components, such as navigation bars, buttons, forms, modals, and more.

Server-side scripting and client-side scripting are two fundamental concepts in web development that refer to where code is executed: on the server (server-side) or on the user's browser (client-side). **Server-side scripting** refers to code that runs on the web server. It is used to manage and deliver content to the client. The primary role of server-side scripts is to handle the backend functionality of a website, such as interacting with databases. **Client-side scripting** refers to code that runs in the user's web browser. It is used to create interactive and dynamic user experiences.

Website hosting is a service that allows individuals and organizations to make their websites accessible on the internet. Web hosts are companies that provide the technologies and services needed for the website or webpage to be viewed in the Internet. Websites are hosted, or stored, on special computers called servers.

Hosting allows your website to be accessible to anyone with an internet connection, providing a global presence. Quality hosting services ensure your website is fast, responsive, and available 24/7. Reliable hosting providers offer technical support to help with any issues related to your website and hosting environment.

PHP (Hypertext Preprocessor) is a widely-used open-source scripting language especially suited for web development and can be embedded into HTML. It is a server-side language, which means the code is executed on the server, generating HTML which is then sent to the client's web browser.

MySQL is a widely-used, open-source relational database management system (RDBMS) that is particularly popular for web applications. It is a central component of the LAMP

stack (Linux, Apache, MySQL, PHP/Python/Perl) and is known for its reliability, performance, and ease of use.

ASP.NET is an open-source, server-side web application framework designed for web development to produce dynamic web pages.

A Content Management System (CMS) is software that enables users to create, manage, and modify digital content without requiring specialized technical knowledge

- \$_GET: Data is visible in the URL.
- \$_POST: Data is not visible in the URL.
- \$_GET: Less secure because data is exposed in the URL.
- \$_POST: More secure as data is not exposed in the URL.
- \$_GET: Limited by the maximum URL length (about 2048 characters).
- \$_POST: No significant data length limit, depends on server configuration.
- \$_GET: Suitable for non-sensitive data like search queries, filtering options, and pagination.
- \$_POST: Suitable for sensitive data like passwords, personal information, and large amounts of data.
